

PDSM581008-MZ

Personal Computer **MZ-80B**

Options

MZ-80EU	(Expansion Port)
MZ-80IO2	(Universal I/O Card)
MZ-80GMK	(Expansion Graphic RAM)
MZ-80FI	(Floppy Disk I/O Card)

Optional Peripherals

MZ-80FB	(Floppy Disk)
MZ-80FBK	(Expansion Floppy Disk)

FEATURES

- The MZ-80B, stepped up version of the MZ-80K, is a personal computer with many new functions.
- Using a Z-80 processor (4MHz Version) in the CPU, it is capable of high speed data processing.
- It has a keyboard touch that's ideal for a professional operator and is equipped with a 10 numerical keys and 10 function keys.
- The cassette-recorder, using an electromagnetic mechanism, can be stopped/started remotely. Programs and data can be recorded automatically.
- With the optional expansion port, I/O card can be set in the body of the MZ-80B for peripherals such as a floppy disk, printer, etc.

Caution in Service

- * Maintain the safety and protecting ability of the apparatus after service.
- * High voltage shall not be rised to excess specified level so as to prevent this apparatus from the extra X-ray radiation.

SPECIFICATIONS

■ MZ-80B General

CPU	LH0080A (Z 80A-CPU)	Key Layout	Keys 92 ASCII Standard, 10 Numerical keys, Function keys, Cursor control keys, Cassette tape deck control keys
Clock	4MHz		
Memory	ROM 2K bytes RAM 64K bytes (dynamic RAM)	Clock function	Built-in
		Editor function	Cursor control; up, down, right, left, home, clear. Edit key Delete key
Display	9" CRT (green display) 8 x 8 dot matrix 1) Characters; 1000 (40 characters x 25 lines) 2) Characters; 2000 (80 characters x 25 lines) 1), 2): software change-over	Power supply	AC 240V (50Hz)
		Temperature	Operating temp; 0° to 35°C Storage temp; -15° to 60°C
		Humidity	Lower than 80%
		Weight	Approx. 16kg
Cassette	Standard audio cassette tape Data transfer speed; 1800 bits/sec. Data transfer system; SHARP PWM Manual or Automatic control	Dimensions	Width 45cm Depth 52cm Height 27cm
		Sound output	400mW max. (440Hz)

■ CPU Board Section

CPU	LH0080A (Z80A-CPU)	1 pc.	Programmable counter	8253	1 pc.
PIO	LH0081A (Z80A-PIO)	1 pc.

RAM	Standard; 16K RAM 32 pcs. (64K bytes) Video RAM; 1 pc. (2K bytes)		Other IC's	40 pcs.	

■ Power Supply Section

Input	AC 240V (50Hz)
Output	5V -5V 12V (stabilizing) 12V (non-stabilizing)

■ Graphic RAM (I) PWB Section

RAM	Static RAM; 4 pcs. (8K bytes)
Other IC's	17 pcs.

NOTE Specifications and appearance are subject to change without prior notice for improvement. In such a case, the explanation here may be a little different from the product.

■ Display Section

I. General specifications		II. Electrical specifications	
Size	9"	Video output	40Vp-p standard (35Vp-p limit)
Vertical Horizontal Frequency	60Hz (vertical), 15.75kHz (horizontal)	Resolution	Horizontal *The pattern of the left in the center of the picture must be clear. 
Power source	DC 12V, 1.1A ±10%	Non-linearity distortion	Horizontal; ±8% (±14% max.) Vertical; ±8% (±12% max.)
Picture tube	E2728B31; 9" 90° deflection explosion proof type Heater; 12V, 75mA	Geometrical distortion	Pincushion dist.; 1% (2% max.) Barrel dist.; 1% (2% max.) Trapezoidal dist.; 1% (2% max.) Parallelogram dist.; 1° (2.5° max.)
IC's	2 pcs.	High voltage	Zero beam; 11.0kV (10.0kV, min., 12.0kV, max.)
Transistors	7 pcs.	Power supply	DC12.0V, 1.05A (1.2A max.)
Diodes	13 pcs.	Working range	12V ±10%
Sound output	400mW max. (440 Hz) Speaker 8cm, round dynamic type (32Ω)	Scan size	Horizontal; 10% (15% max.) Vertical; 10% (15% max.)
Control knobs	Volume, V-Hold, Contrast, H-Hold, Brightness, Focus	Horizontal lock-in range	±300 Hz (±100Hz limit)
		Vertical lock-in range	-12 Hz (-6 Hz limit)
Working temperature	-10°C to 50°C	Audio frequency characteristic	440 Hz (0dB) -10dB ±4dB at 100 Hz -12dB ±4dB at 10kHz
		Sound maxi- mum output	400mW at 440 Hz

■ Cassette Tape Recorder Section

System	PWM recording	Biasing	DC system
Power source	5V ± 5%	Erasing	DC system
	12V ± 5% (stabilizing) 9.5V~16.5V (Non-stabilizing)	Playback sensitivity	667 μsec. to 333 μsec. (standard)
Semi- conductors	22 transistors 13 ICs 9 diodes	Working temperature	-10°C to +40°C
Tape	From C30 to C60	Storage temperature	-25°C to +65°C
Tape speed	4.75 cm/sec.		
Track	2-track monaural type		
Motor	Electronic governor motor (12V)		

SYSTEM CONFIGURATION AND NOMENCLATURE OF MZ-80B

The MZ-80B system and expansion thereof are shown in the block diagram of Fig. 1. The inside of the dotted lines is the constitution of the MZ-80B, in which units enclosed in thick-line frames are optional ones. In the expansion port, interface cards can be inserted up to six pieces. The devices outside the dotted lines are optional peripheral devices and user's devices.

Figures 2 and 3 show the front view and rear view of the MZ-80B, identifying the parts with names.

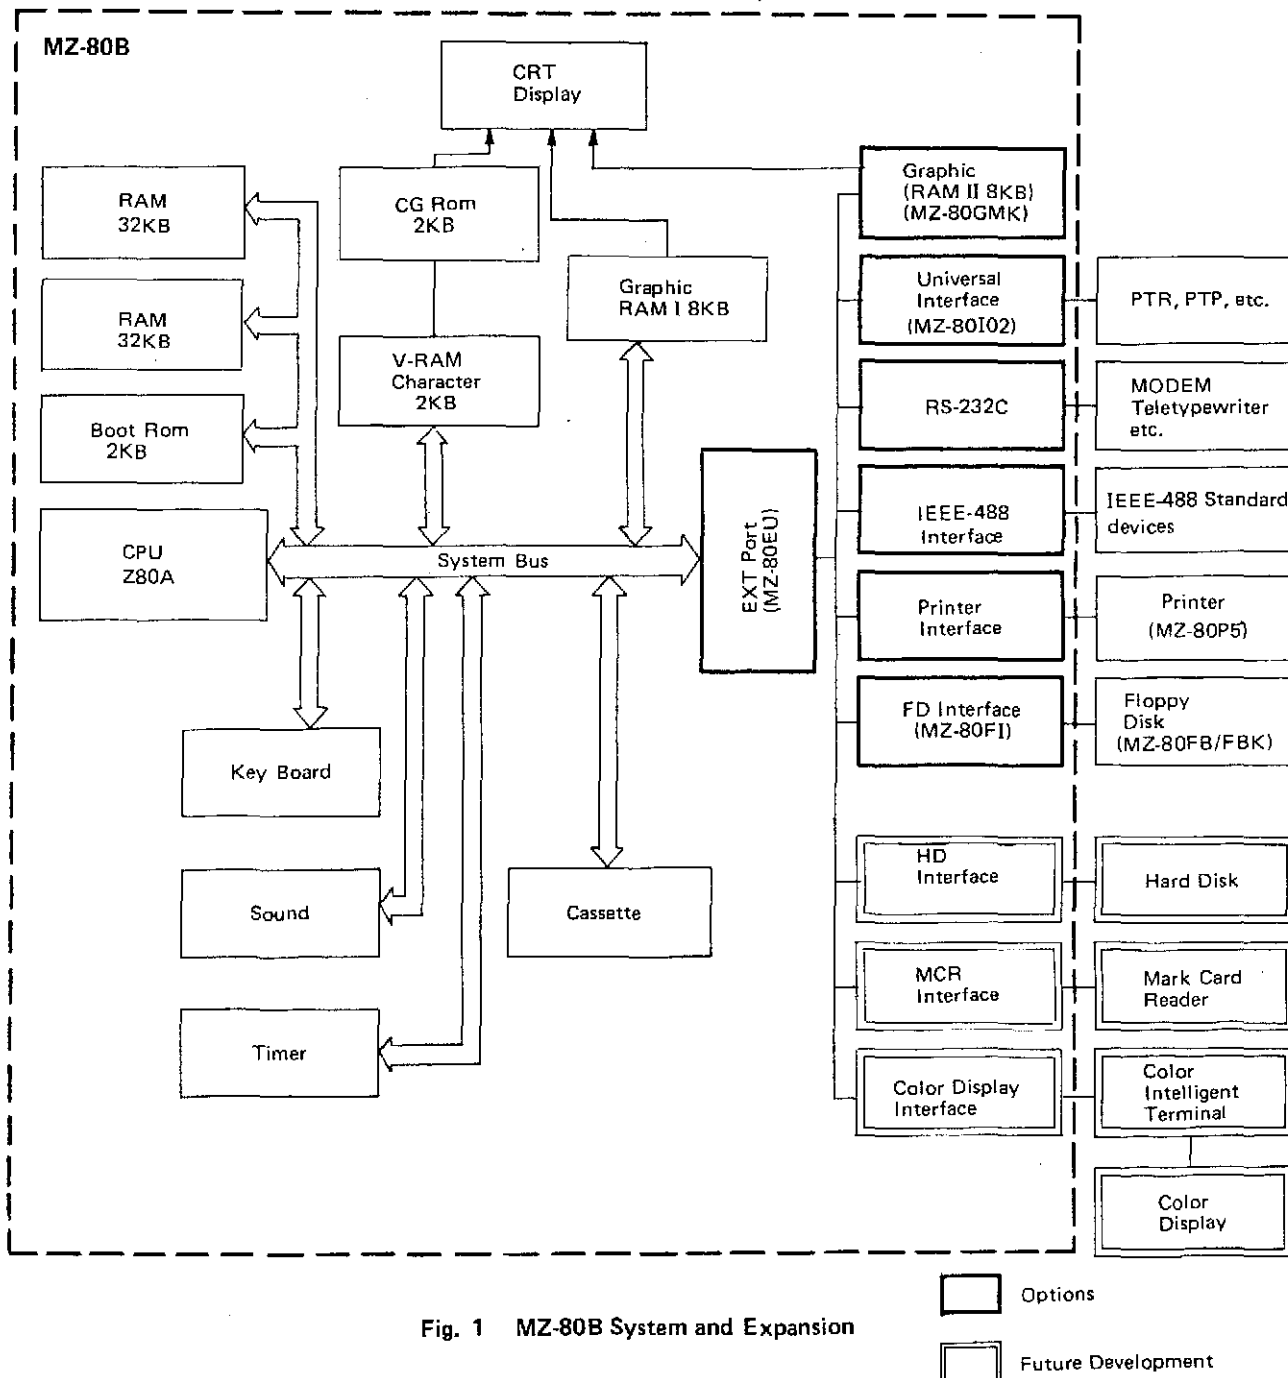

Fig. 1 MZ-80B System and Expansion

Fig. 2 Front View of MZ-80B

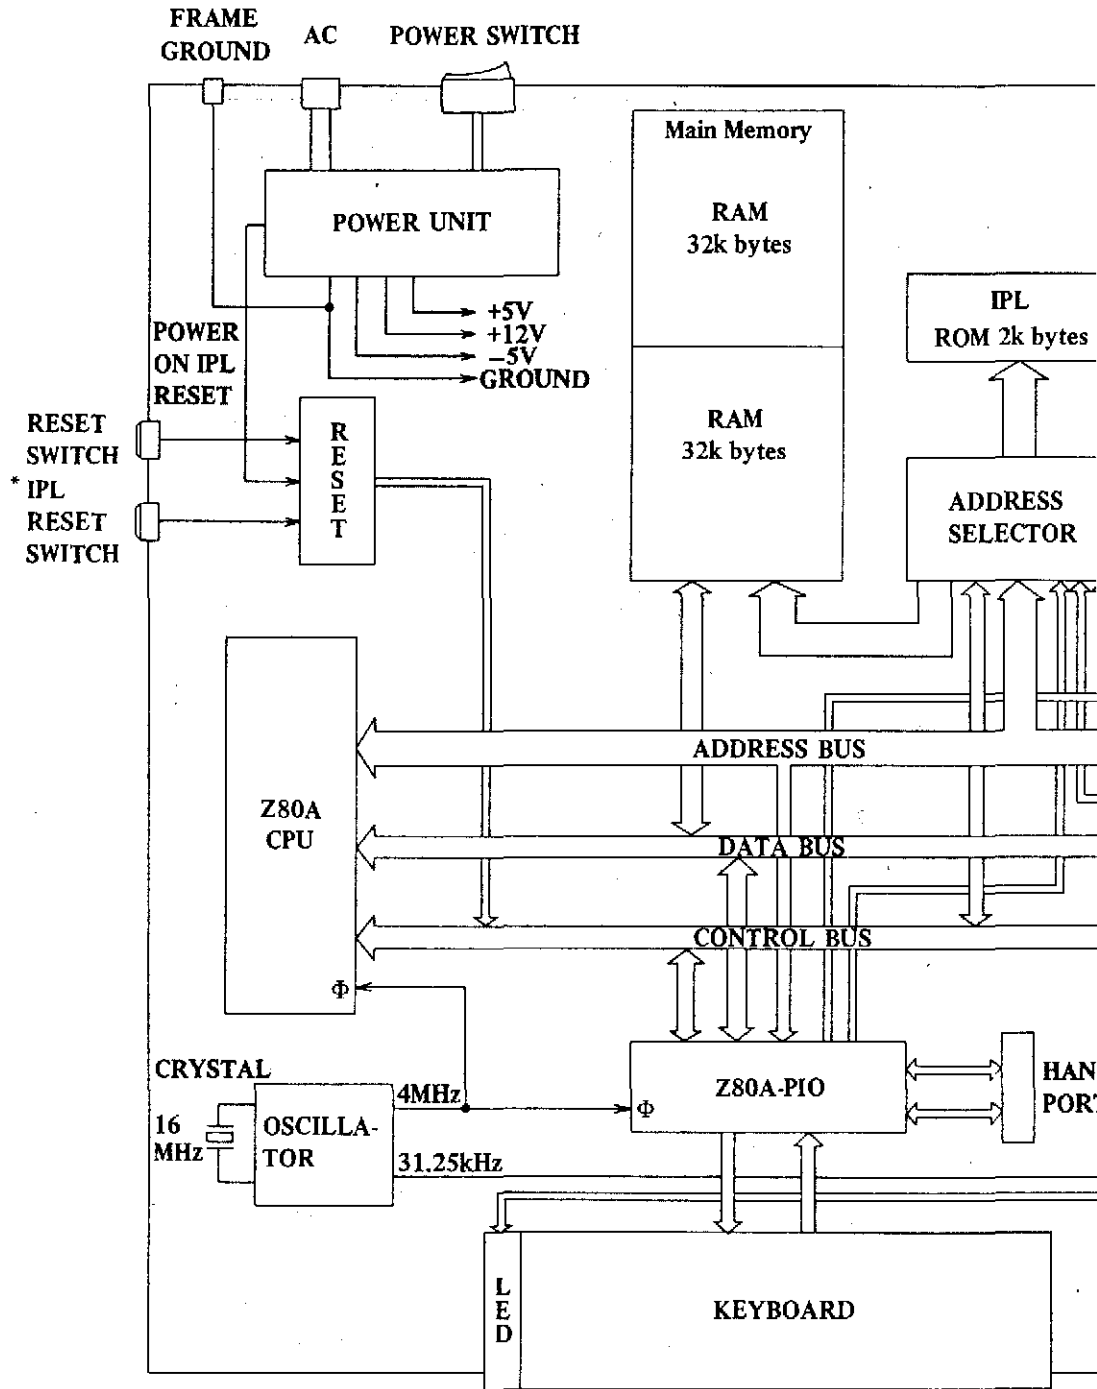

Fig. 3 Rear View of MZ-80B

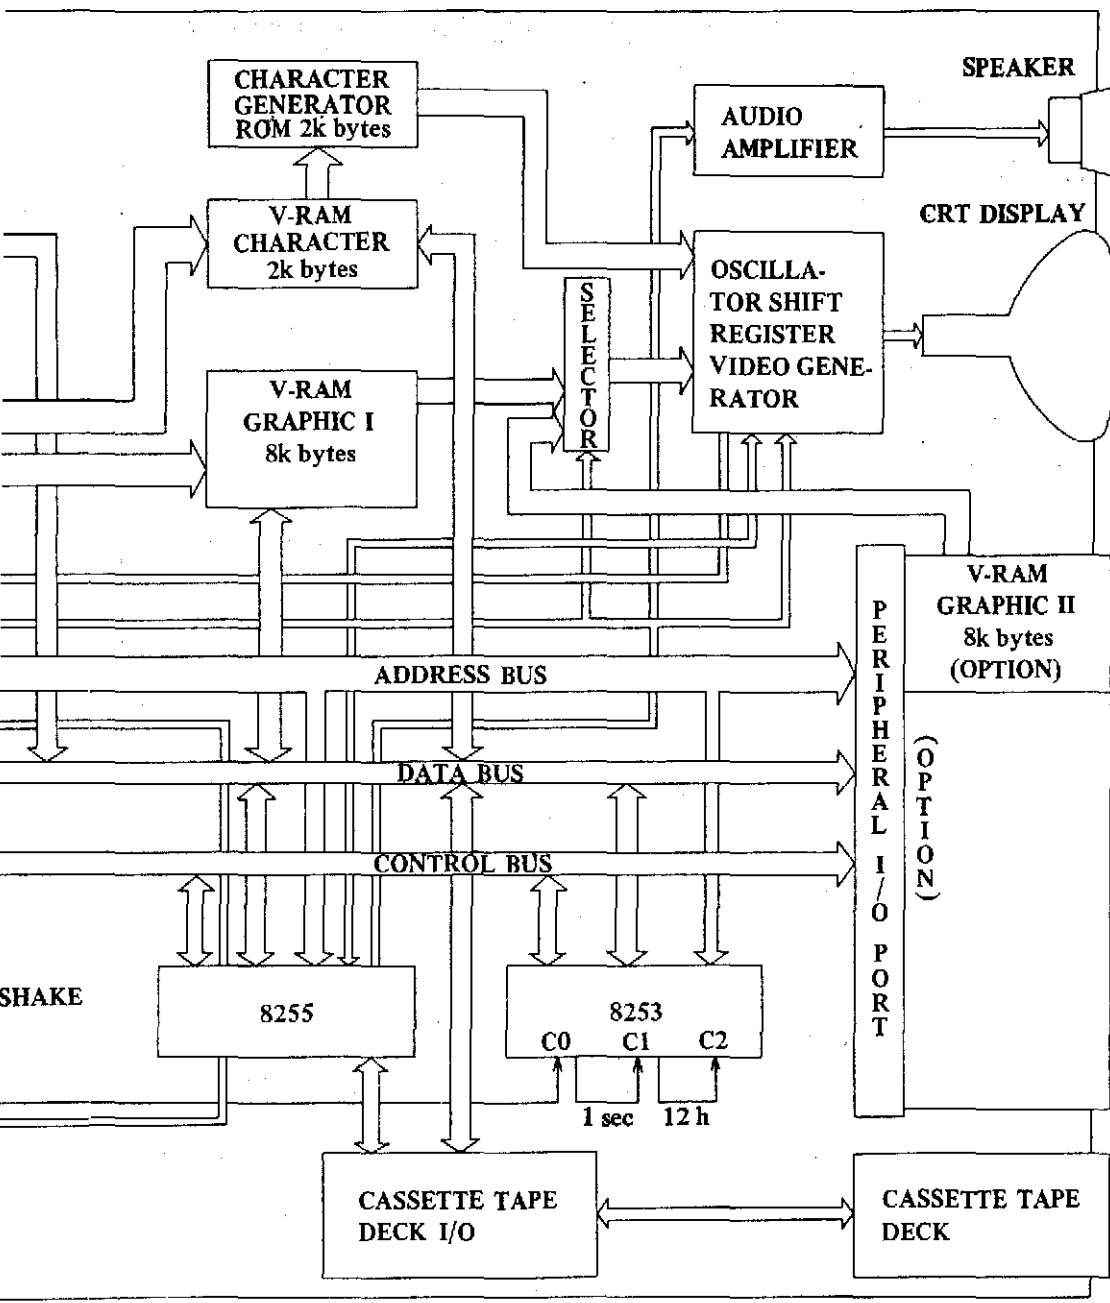

CONFIGURATION OF MZ-80B

The system diagram of the MZ-80B is shown in Fig. 4. With the CPU and its bus lines in the center, the memories (main memory, boot ROM, V-RAM), keyboard, cassette recorder, CRT display, clock, reset circuit, and I/O port are arranged, showing the relations with PIO, 8225, 8253, to constitute the MZ-80B.

-80B System Diagram

TROUBLESHOOTING GUIDE

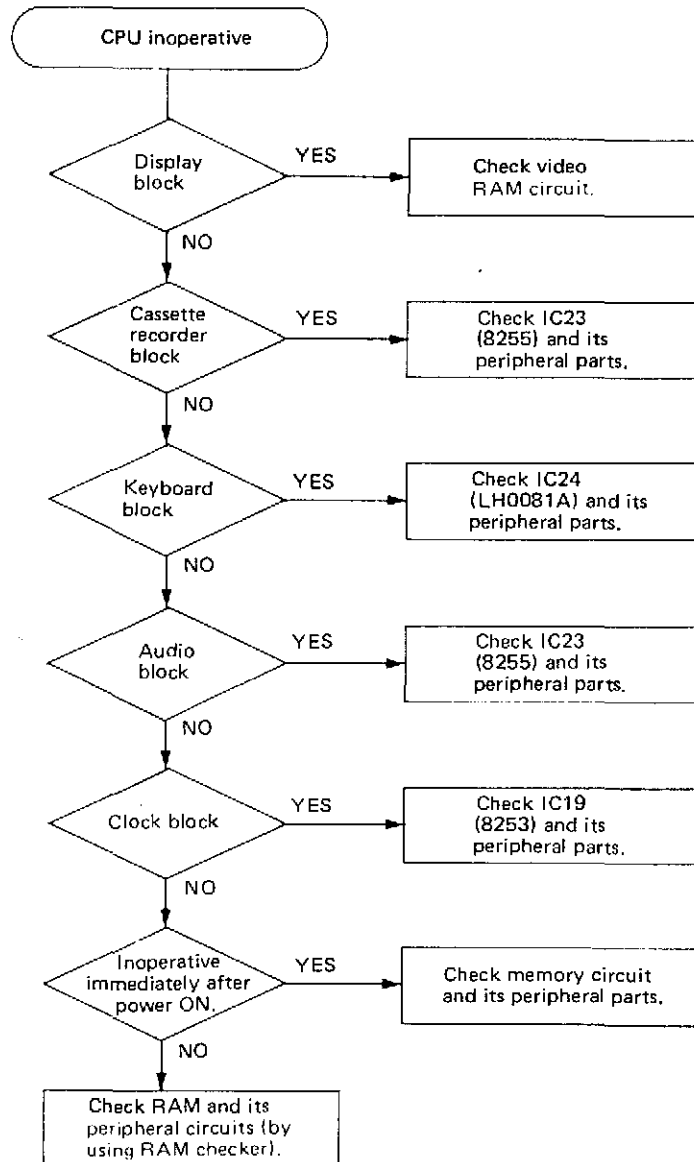

The system comprises four main units.

For quick solution to most operational difficulties, follow the chart below to find which unit is causing the problem.

CPU BOARD SECTION

The CPU board is composed of the following six blocks. When it malfunctions, first locate which block is concerned with the malfunctions, and next try to check for its corresponding circuits; the wiring diagrams of every block will be shown separately.

■ Checking methods of each circuit

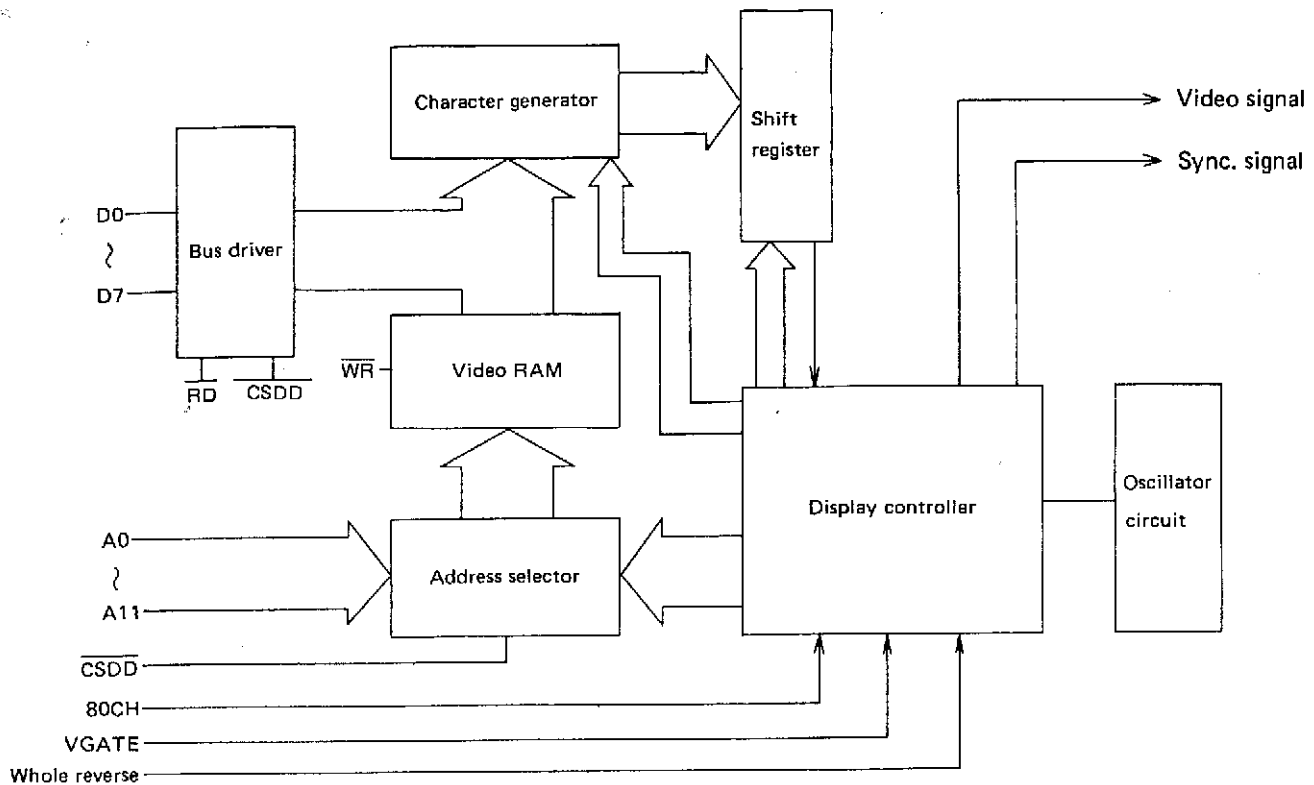

1. By touching IC package by fingers:

- If they seem too hot by heat generation; IC is defective, IC load is heavy or components are touching each other (ROM and V-RAM are exempted from this checking).
- If a circuitry state changes to another; Soldering is poor, socket contact is improper or printed-wiring is erroneous.

2. By using a synchroscope:

- If the relation between input and output of TTL IC is illogical, this means defective IC gate.
- Check if the voltage of TTL IC is as specified: High level; over 2.4V, Low level; below 0.5V.
- When the signal is between the high and low levels, is there circuit touching or IC malfunction?

■ Display Block

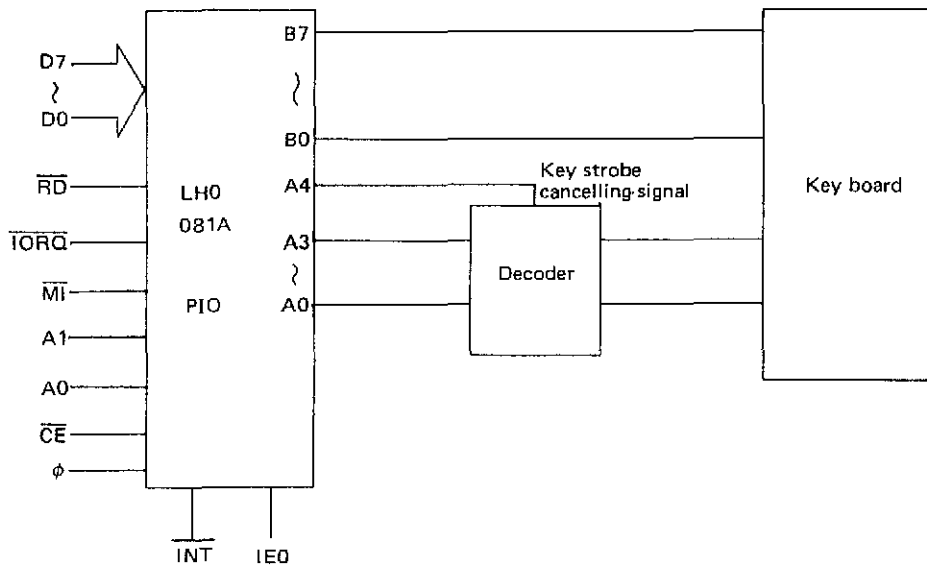

Block Diagram around Video RAM

Problem	Check Point
No sync. signal	<p>Is the correct signal present at pins 12 and 13 of IC36 ?</p> <p>Yes: Check IC36.</p> <p>No: Check IC42 and IC43 and around them. (In particular, check if the input of 8MHz, 16MHz and other clocks are correct (Wave form is shown on page 15.))</p>
No video signal	<p>Is pin 16 of IC42 at a high level ?</p> <p>No: Check IC23.</p> <p>Yes: Proceed to the following.</p> <p>Is a video signal present at pin 8 of IC46 ?</p> <p>Yes: Check IC31, IC33 and IC36.</p> <p>No: Check IC42 and IC43 and around them. (In particular, check if the input of 8MHz and 16MHz and other clocks are correct (Wave form is shown on page 15.))</p>
Characters displayed but position abnormal	<p>Is the signal at pins 3, 6, 10 and 13 of IC37, IC38 and IC39 correct ?</p> <p>Yes: Check the address of IC41 and the signals of IC37, 38 and 39 connected to it.</p>

<p>Position is correct but characters are abnormal</p> <p>Displayed characters are abnormal</p>	<p>No: Check IC 37, 38, 39, 42 and 43.</p> <p>Check the common line of IC22, IC41 and IC44 and around the IC22.</p> <p>Check $A_3 - A_0$ and $D_7 - D_0$ of IC45 and IC42.</p>
---	--

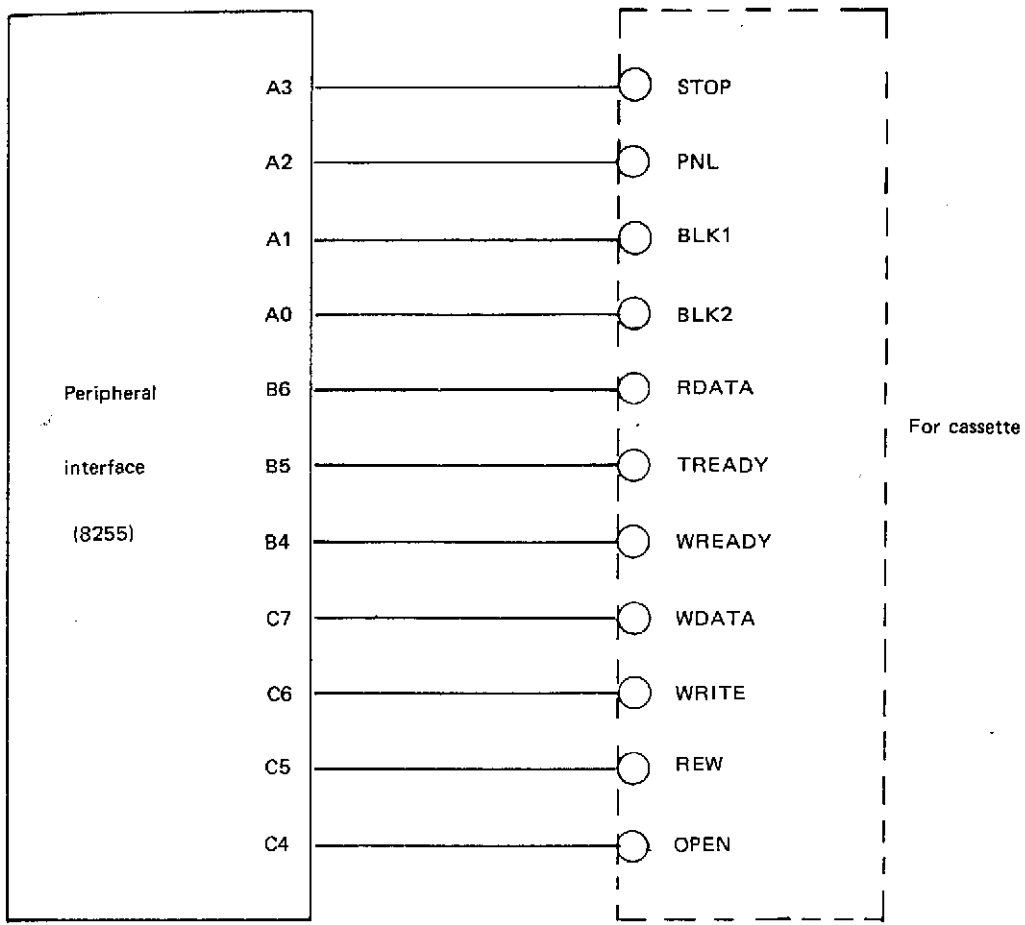

■ Keyboard Block

Block Diagram around Keyboard

Problem	Check Point
Does not accept key entry.	<p>Is key strobe present ?</p> <p>Yes: Check keyboard, IC24 and around it.</p> <p>No: Check IC25, IC27, IC28, IC29 and IC36. If they are normal, check IC24 and around it.</p>

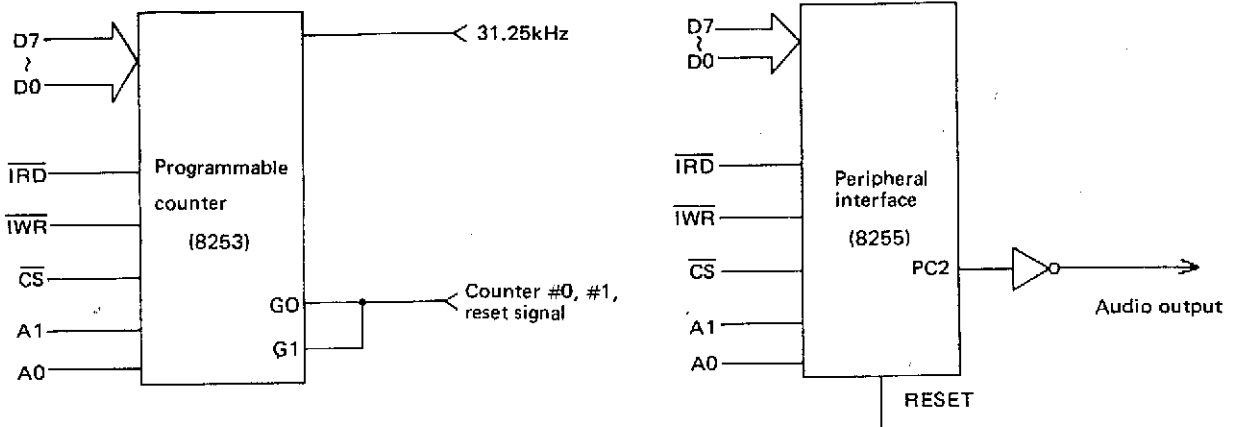

■ **Cassette Block**

Block Diagram around the Cassette

Condition	Check Point
Load is not possible.	Is there a signal from pin 6 of IC 26? YES: Check IC23. NO: Check IC26.
Save is not possible.	Is there a signal from pin 10 of IC23? YES: Check IC26. NO: Check IC23.
Motor does not turn.	Check IC23.
Motor does not stop.	Check IC23.

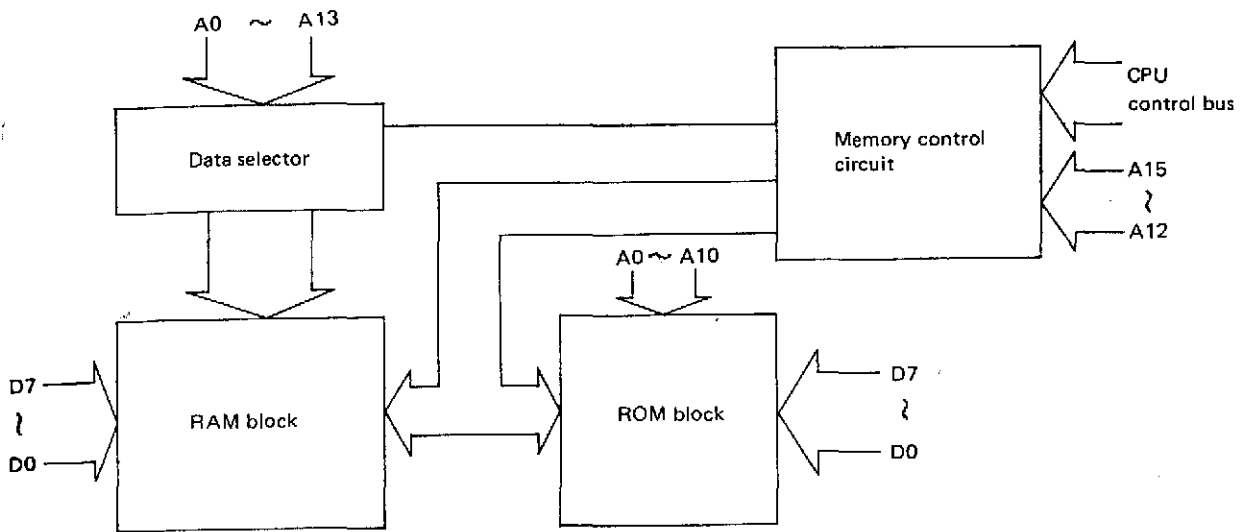

■ Clock/Audio Block

Block Diagram around Clock/Audio Block

Problem	Check Point
<p>Clock function is abnormal.</p> <p>Audio output is abnormal.</p>	<p>Is there a 31.25kHz signal present at pin 9 of IC19?</p> <p>Yes: Check IC19 (8253) and around it.</p> <p>No: Check IC42 and around it.</p> <p>Is an output signal present at pin 4 of IC31?</p> <p>Yes: Check amplifier section in the display board.</p> <p>No: Check IC23, IC31</p>

Memory/Reset Circuit Block

Memory/Reset Circuit

Problem	Check Point
Picture "panic" when power is on.	<p>Does pin 26 of IC3 go from High to Low when the BOOT reset SW is pushed ?</p> <p>No: Check IC33</p> <p>Yes: Proceed the following.</p> <p>Is pin 15 of IC2 High ?</p> <p>No: Check IC34</p> <p>Yes: Check address line A0 – A15 (IC6, IC10)</p> <p style="padding-left: 40px;">Data line D0 – D7 (IC11)</p> <p style="padding-left: 40px;">Control line (IC7)</p> <p style="padding-left: 40px;">IC2, IC8, IC14, IC16</p>
Abnormal action immediately after end of program due to BOOT program	<p>Is pin 15 of IC2 at Low Level ?</p> <p>Yes: Check IC34</p> <p>No: Check IC2</p>
Error when program is in RAM	Check RAM

* How to Use RAM CHECKER

Insert RAM CHECKER into BOOT ROM socket and turn the power on. Then RAM TEST-1 and RAM TEST-2 will automatically be carried out from RAM address \$0000 to address \$FFFF as shown below and the tested results will be displayed.

The checker tests the store by dividing it into two parts of addresses \$0000 to \$7FFF and \$8000 to \$FFFF.

Example of the test results (When all RAM's are normal)

Check RAM (I) block, 16K bytes, RAM (II) block 16K bytes

```
RAM TEST-1  0000-OK
             4000-OK
RAM TEST-2  00 FF 00 FF F0 OK
```

The checker continues to check the RAM (III) block 16K bytes and RAM (IV) block 16K bytes.

```
RAM TEST-1  8000-OK
             C000-OK
RAM TEST-2  00 FF 00 FF F0 OK
```

1) RAM TEST-1

A write/read test of data \$00 and \$FF is carried out from address \$0000 to \$FFFF, and if an error occurs ERROR is displayed in the 16K bytes unit.

Example of above mentioned display

```
0000 OK ..... Result of write/read test from address $0000 to $3FFF is normal.
```

Example of display when ERROR appears.

```
ER-235B-00, 01 ..... Write in data was $00 at address $235B but read-out data was $01.
```

An error is displayed by the address number at which the error takes place, and the execution of check is stopped at the address.

2) RAM TEST-2

Write/read test is carried out with the following items.

- Write-in data \$00 (From address \$0000 to \$7FFF)
- Write-in data \$FF (From address \$0000 to \$7FFF)
- Write-in data \$00 (From address \$7FFF to \$0000)
- Write-in data \$FF (From address \$7FFF to \$0000)
- Write-in data \$F0 and \$0F entered alternately (From address \$0000 to \$7FFF and vice versa.)
- Write-in data \$00 (From address \$8000 to \$FFFF)
- Write-in data \$FF (From address \$8000 to \$FFFF)
- Write-in data \$00 (From address \$FFFF to \$8000)
- Write-in data \$FF (From address \$FFFF to \$8000)
- Write-in data \$F0 and \$0F alternately (From address \$8000 to \$FFFF and vice versa)

Example of ERROR in RAM TEST-2

```
RAM TEST-2  00 FF 00 ER-23FF-01
```

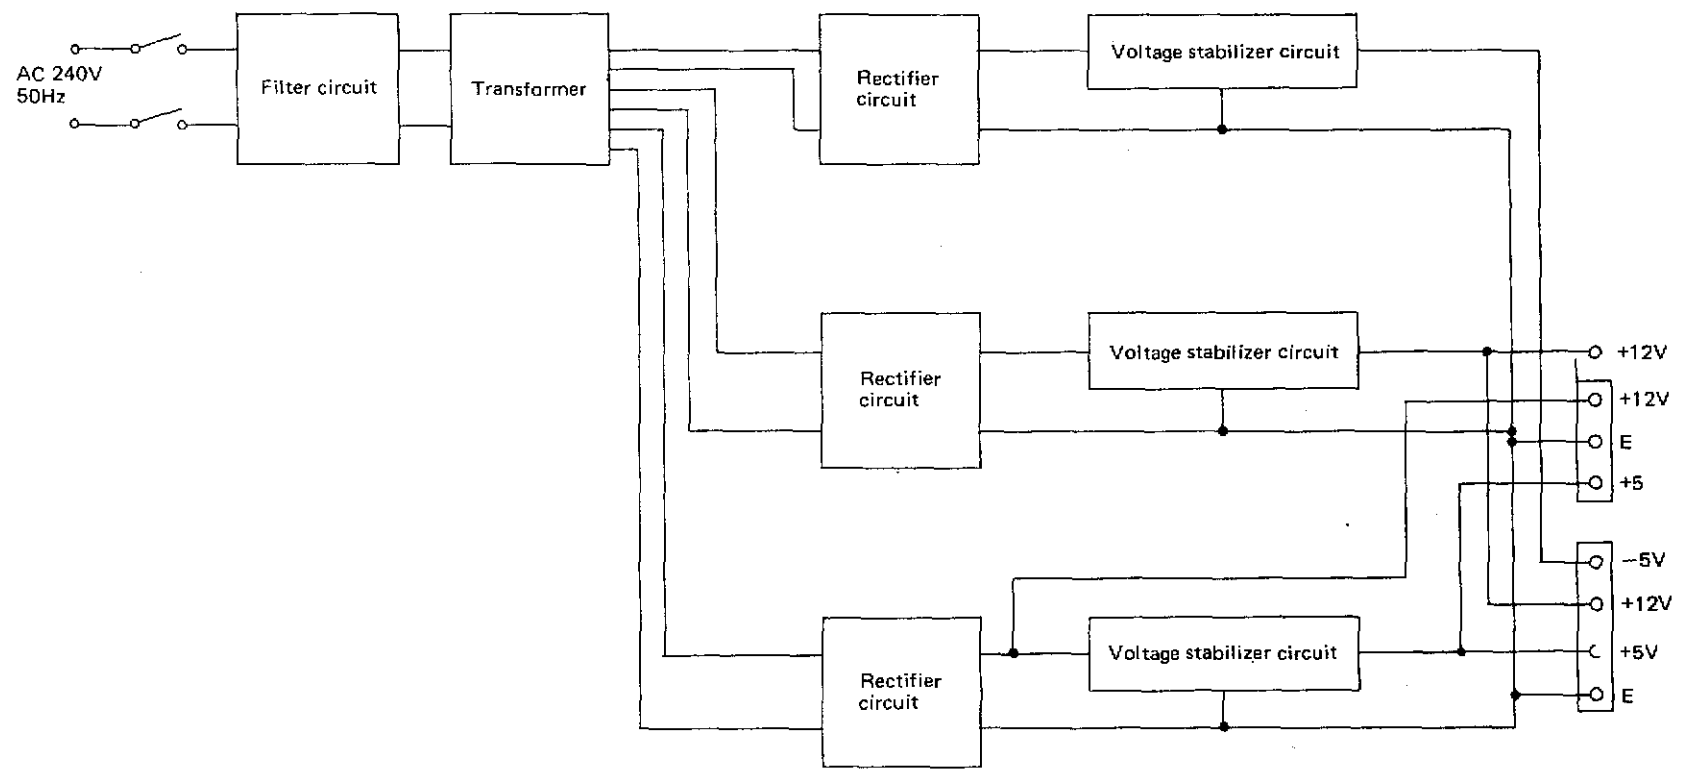

Test results of a) and b) were normal but in c), although data \$00 was written in address \$23FF, read-out data was \$01. When ERROR is displayed in the above mentioned RAM TESTs, decide which RAM block is bad according to the memory address where the error occurs. Then you can decide which RAM is bad in the RAM block where the error occurs by the bytes pattern of the write-in data and read-out data. In the above example, you can tell that it's RAM (I) block by \$23FF and that RAM 1 is bad because write-in data is \$00 but read-out data is \$01. (See Fig. next)

	D7	D6	D5	D4	D3	D2	D1	D0	
Write-in date \$00	0	0	0	0	0	0	0	0	Error to occur
Read-out data \$01	0	0	0	0	0	0	0	1	

■ Waveforms of CPU Board

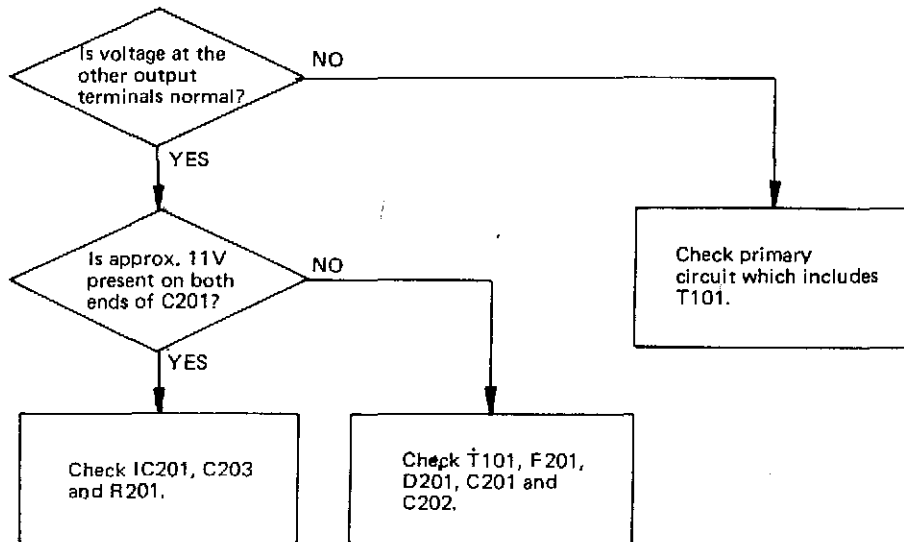

Block Diagram of Power Supply Circuit

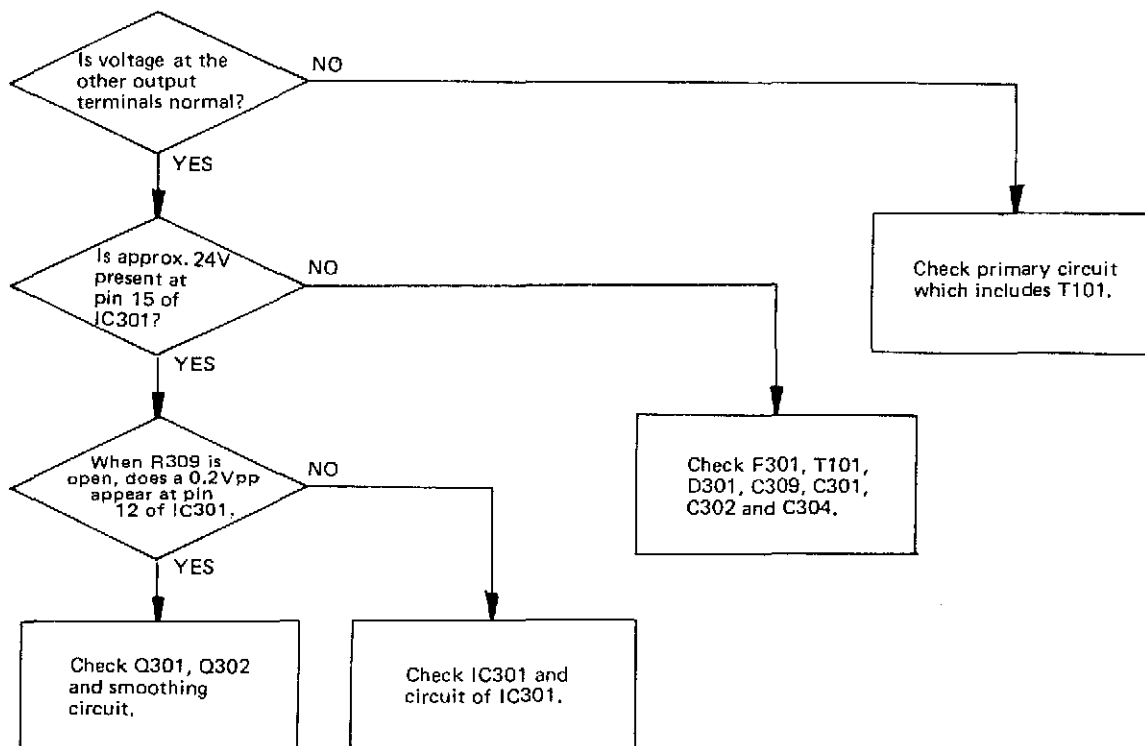

■ Trouble Shooting Chart

Problem (1) No voltage at any output terminal.
Check primary circuit which includes the transformer.

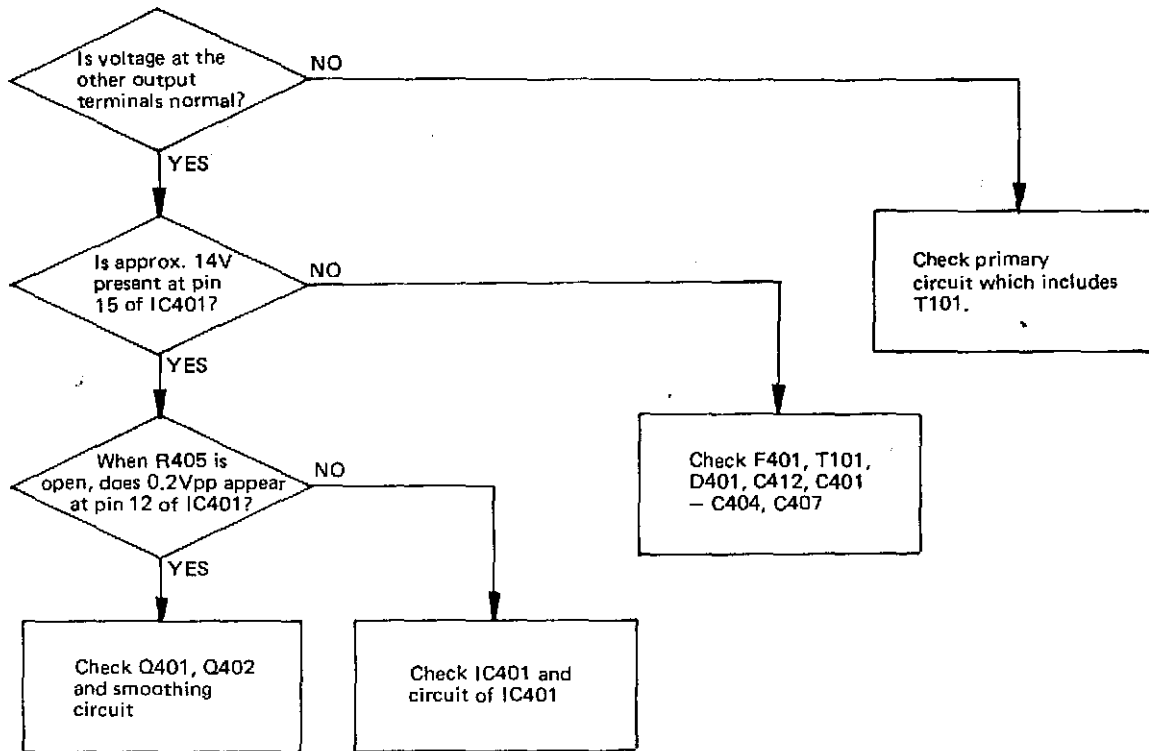

Problem (2) No. -5V.

Problem (3) No +12V.

Problem (4) No +5V.

Problem (5) -5V is abnormally high.
Check IC201

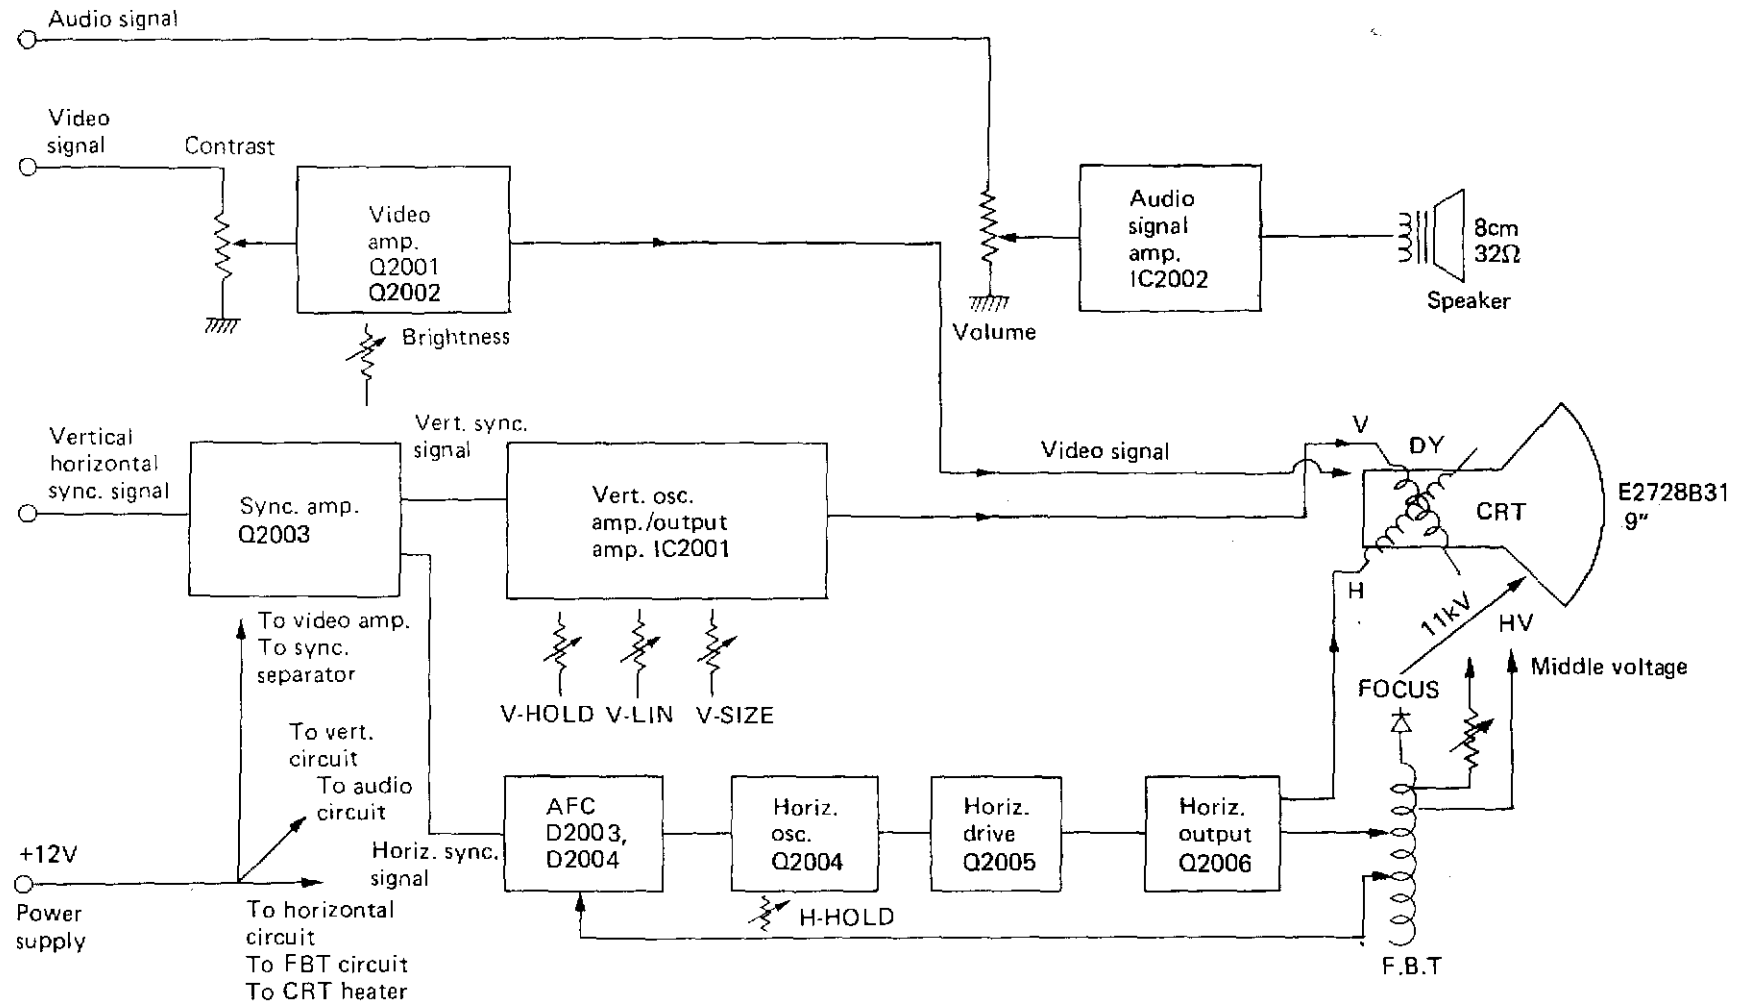

Problem (6) +12V is abnormally high.
Check Q301, Q302 and IC 301.

Problem (7) +5V is abnormally high.
Check Q401, Q402 and IC401.

■ Waveforms of Power Supply Circuit

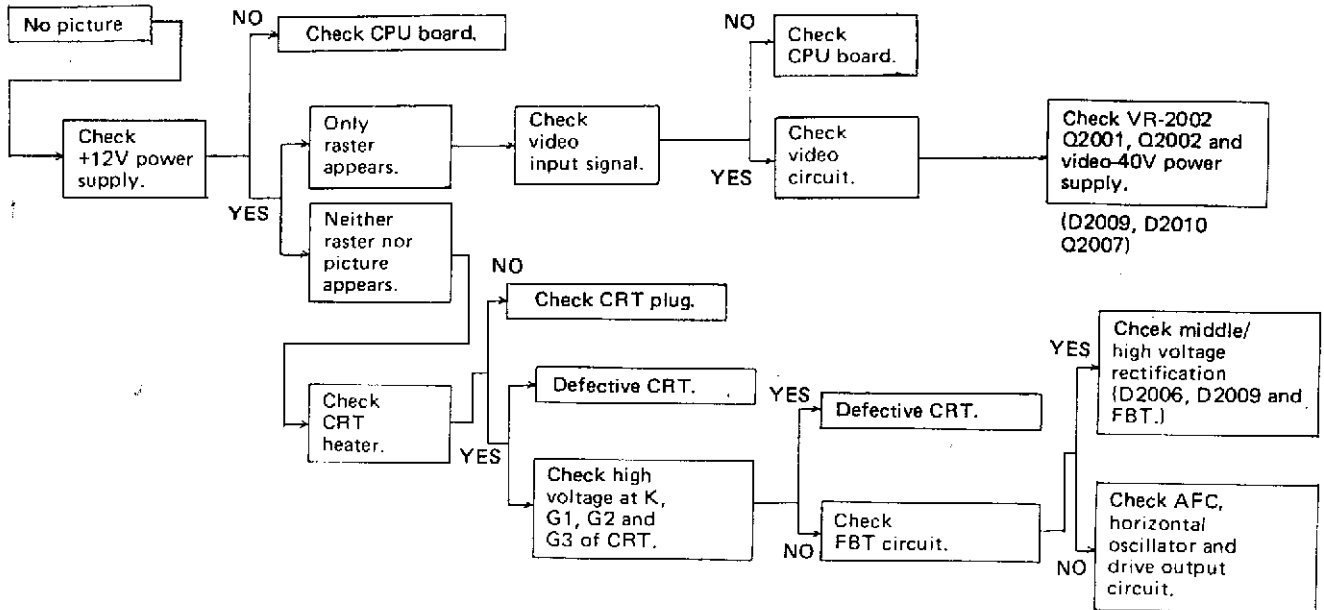

These are basic waveforms when the load current of +5V 2.5A, +12V 1.25A and -5V 10mA flow from the output terminals.

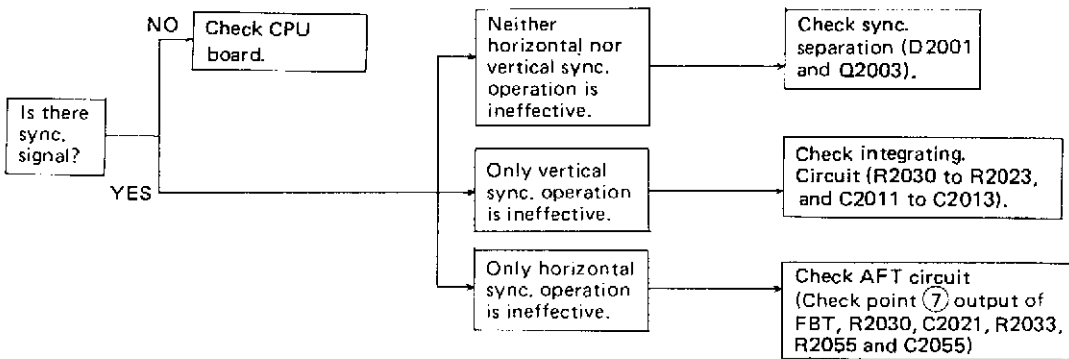

Block Diagram of Monitor TV Section

■ Trouble Shooting Chart

Problem 1: No picture appears.

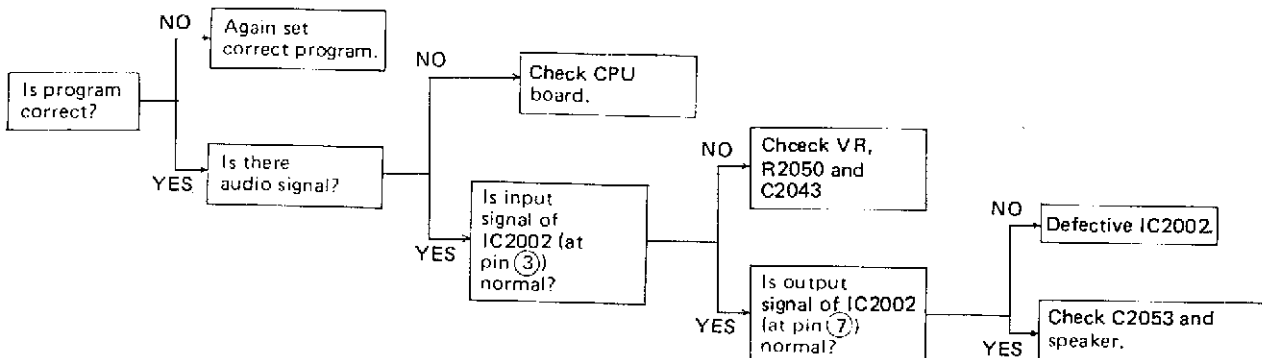

Problem 2: Sync operation remains ineffective.

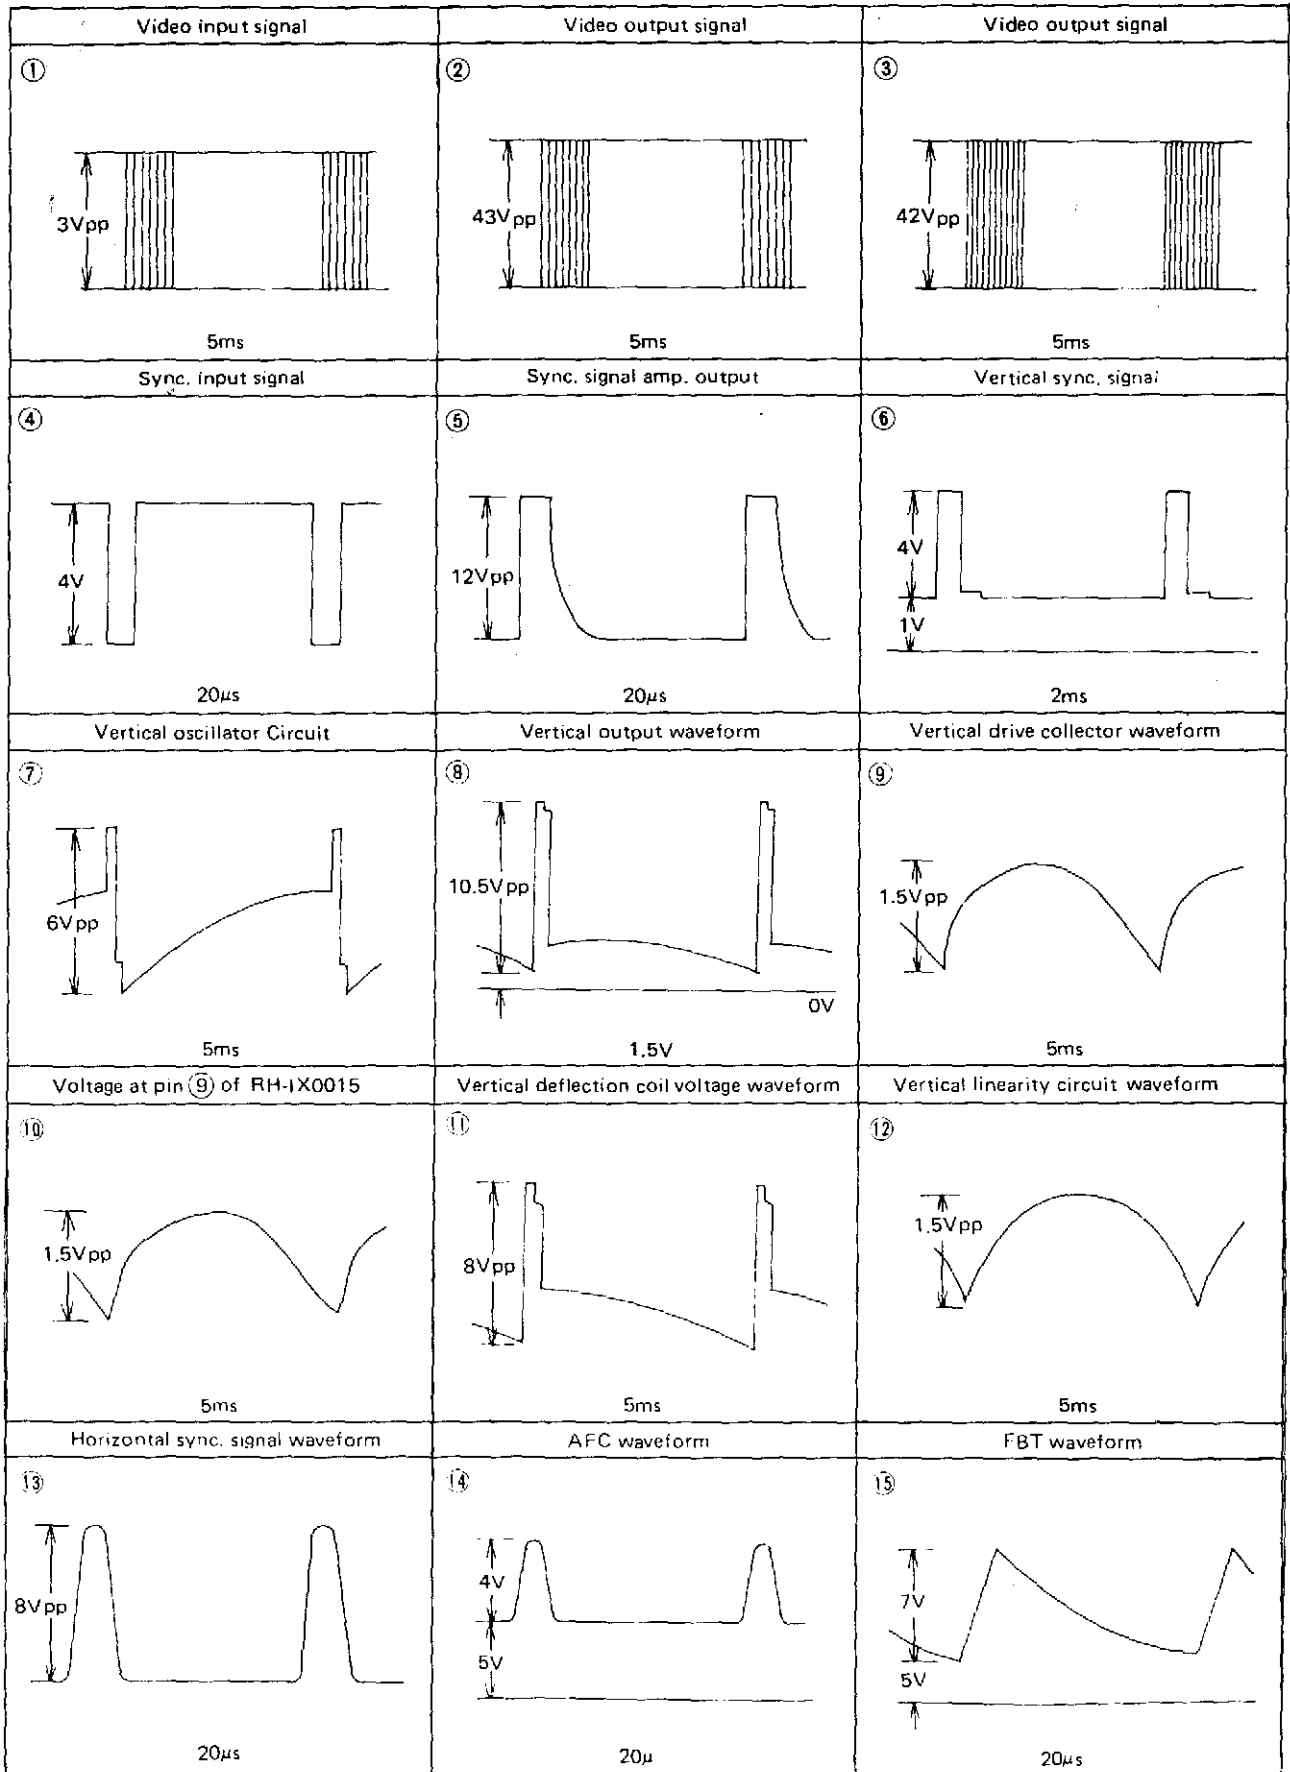

Problem 3: Raster is too narrow.

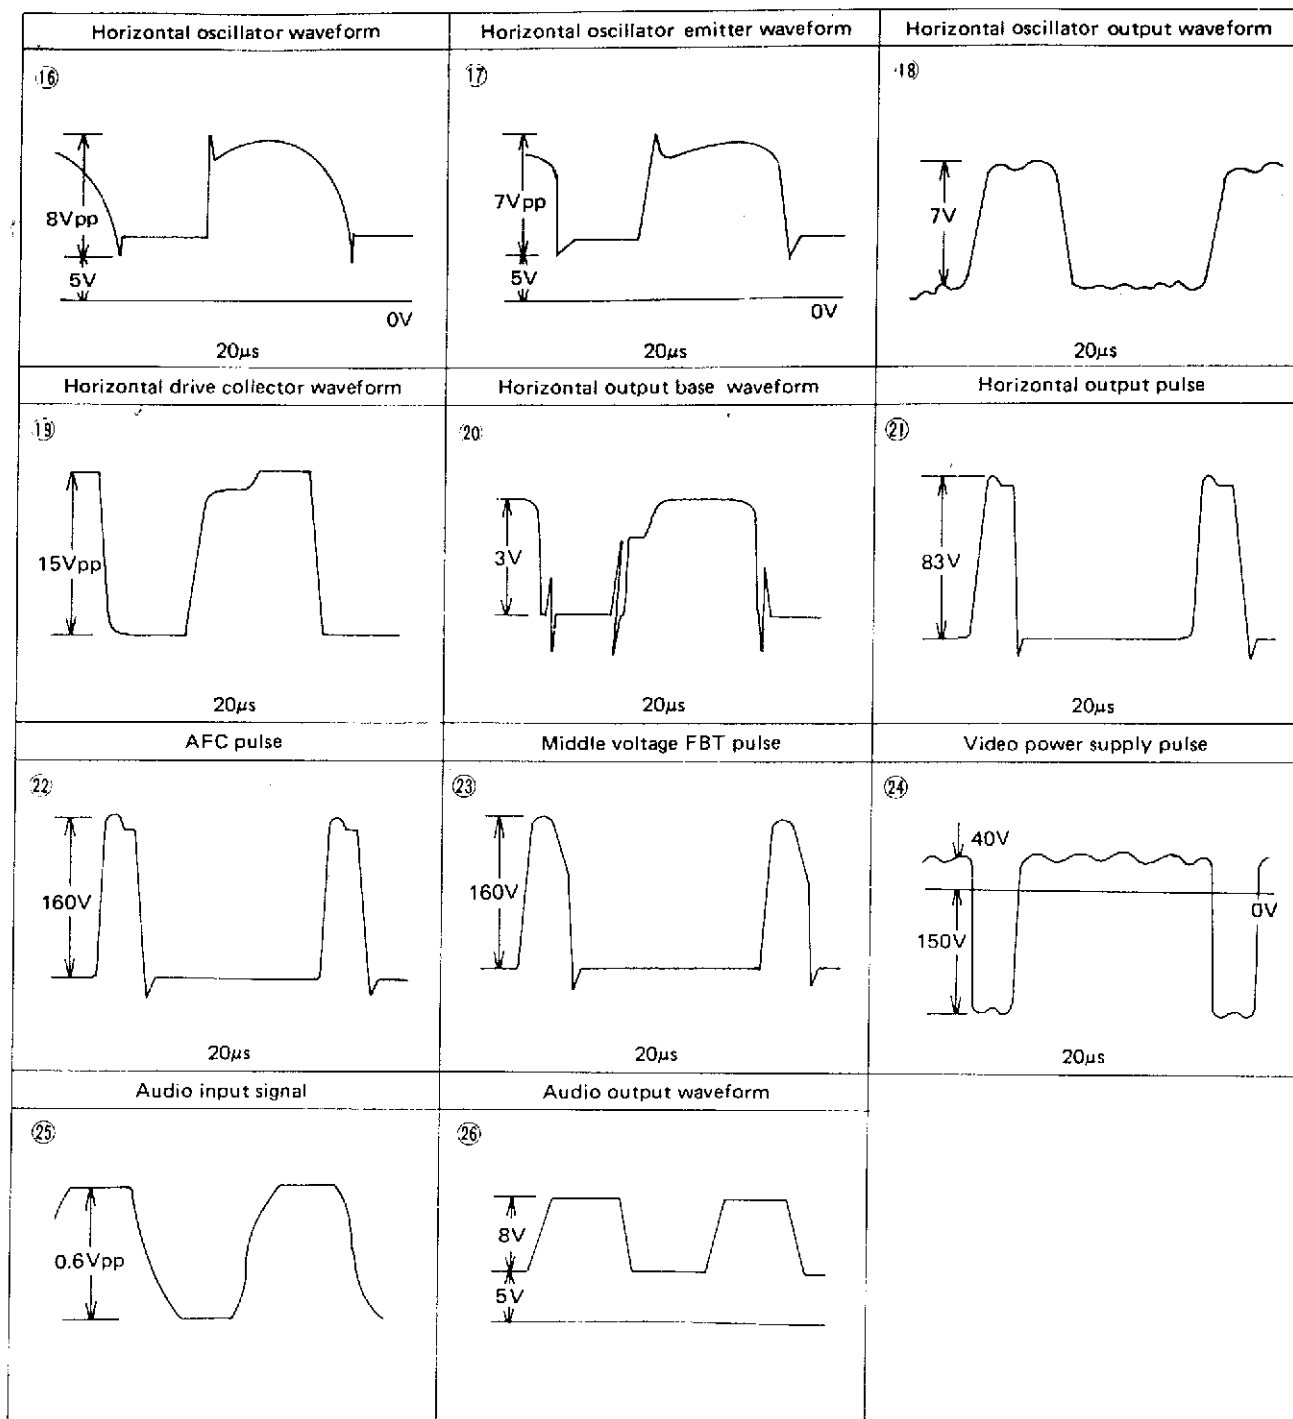

Problem 4: No sound comes out.

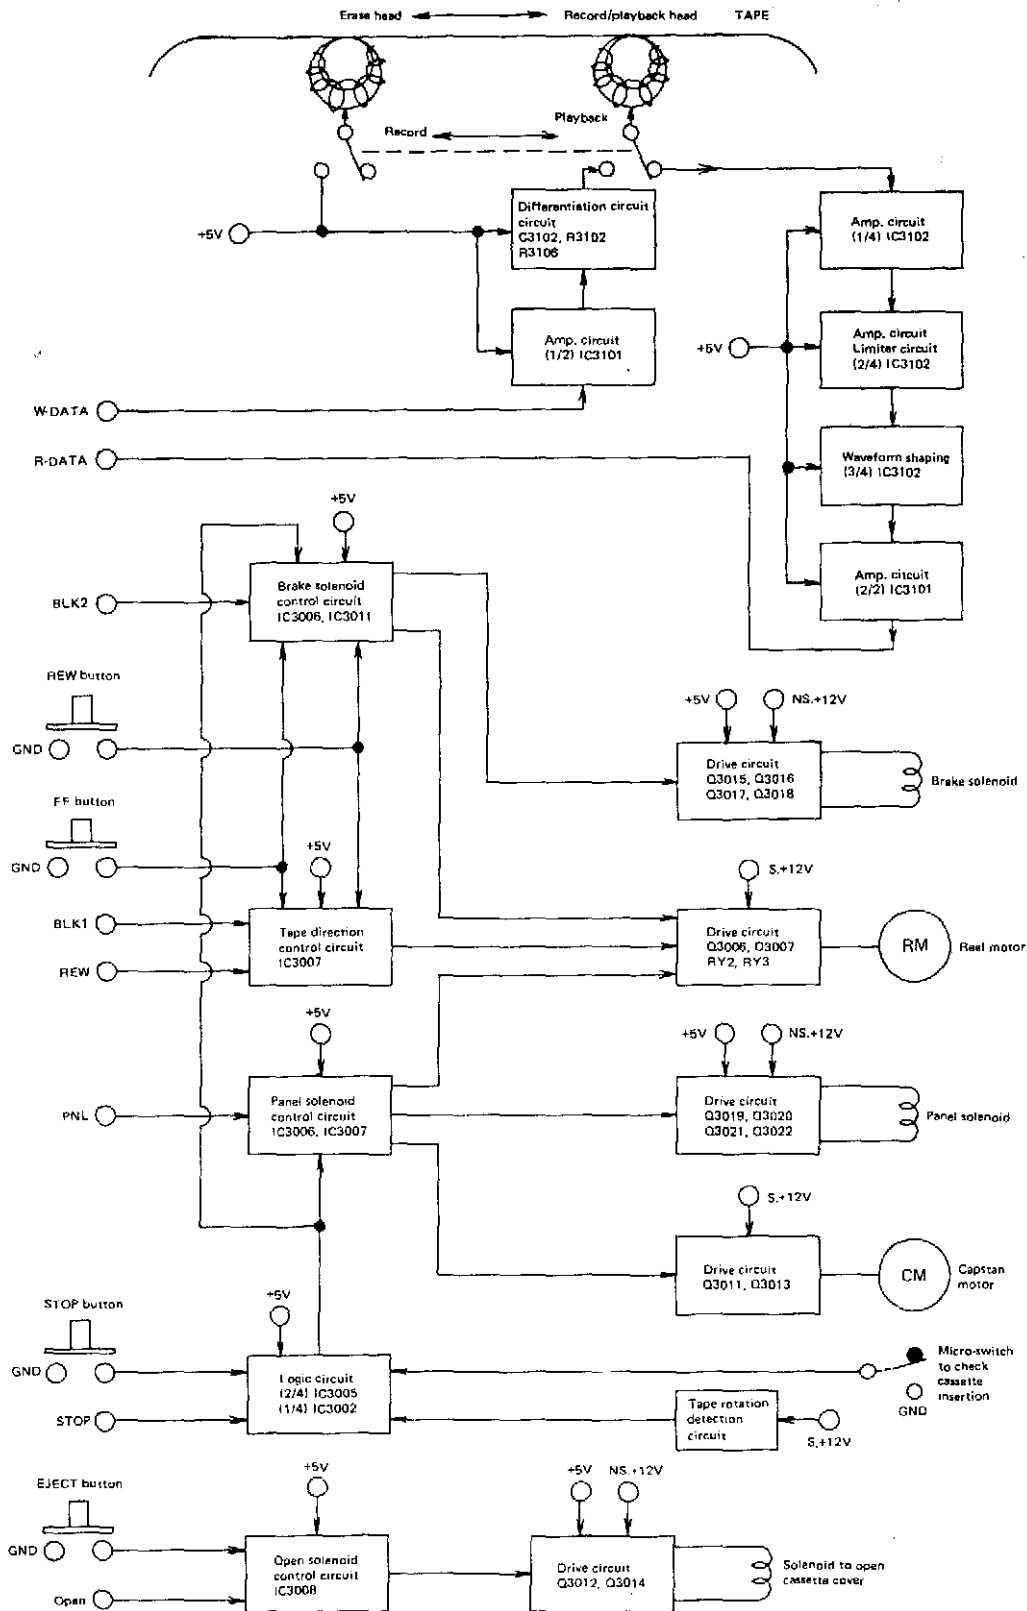

■ Waveforms of Monitor TV Section

The figures encircled by \bigcirc in the above refer to those of "Wiring Diagram" --- "Check Points of Waveforms".

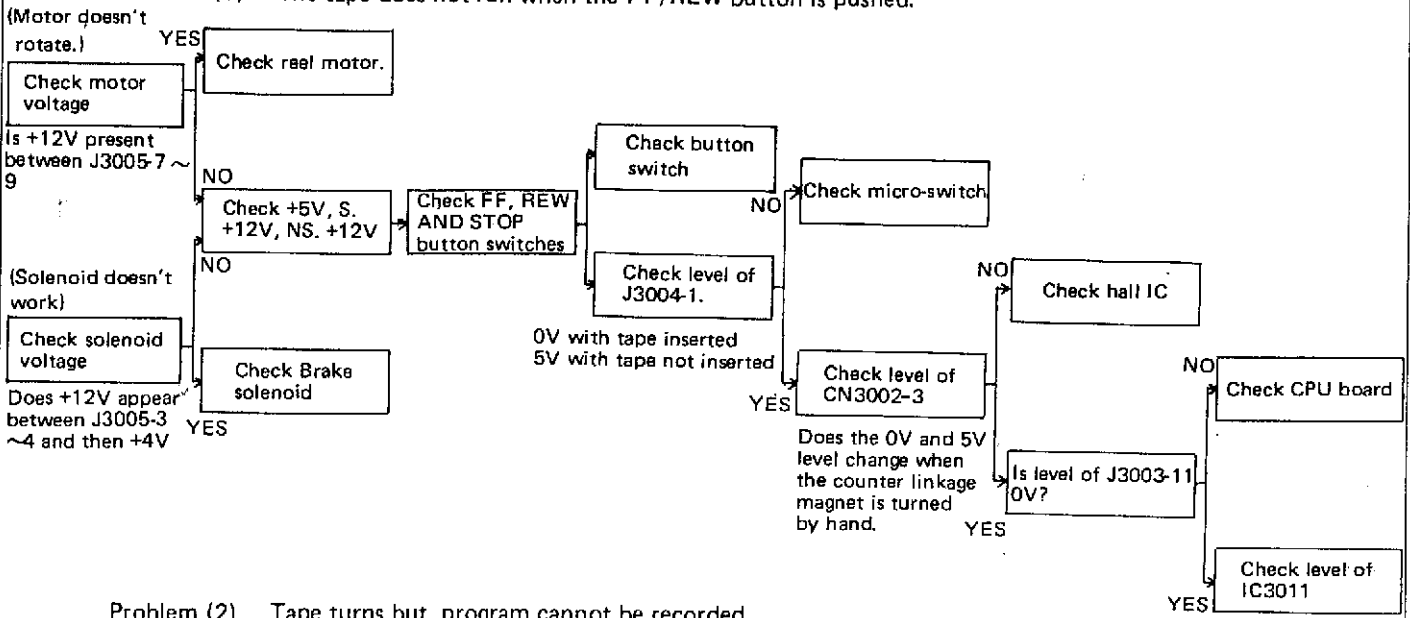

CASSETTE TAPE RECORDER SECTION

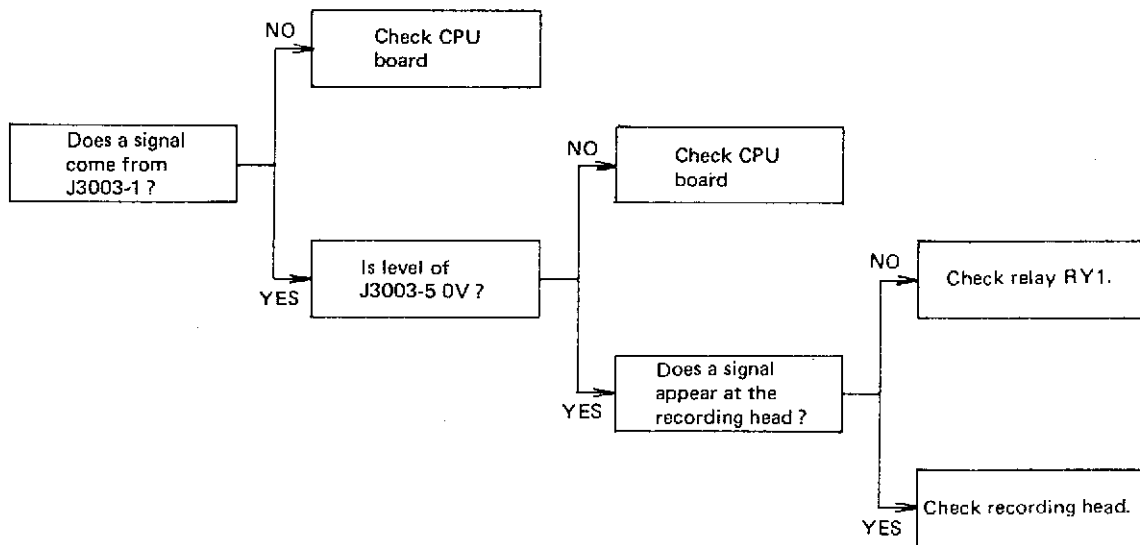

Block Diagram of Cassette Tape Recorder

■ Trouble Shooting Chart

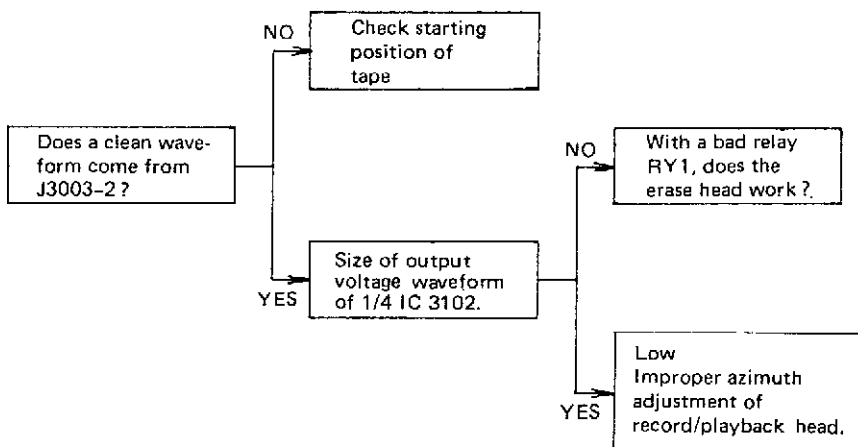

Problem (1) The tape does not run when the FF/REW button is pushed.

Problem (2) Tape turns but, program cannot be recorded.

Problem (3) Tape turns, but programs cannot be played back or an error occurs.

■ Azimuth Adjustment and Head Cleaning

* Azimuth adjustment of record/playback head

1. Connect a synchroscope to pin 8 of IC3102.
2. Load a test tape (TEAC, 3kHz-signal recorded) and play it back.
3. Rotate the azimuth adjusting screw so that the waveform on a synchroscope will be the maximum.

Head cleaning

Clean the heads, capstan and pinch roller often, to remove dust and tape residue. Foreign material on them impairs the sound quality of both recording and playback.

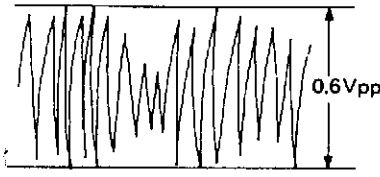

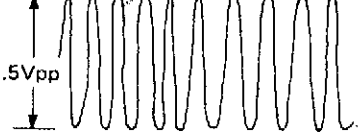

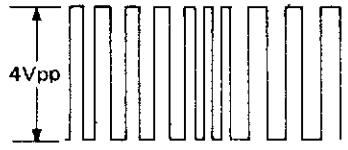

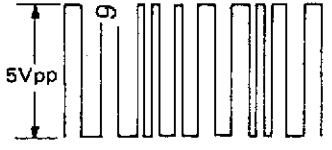

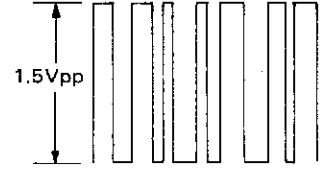

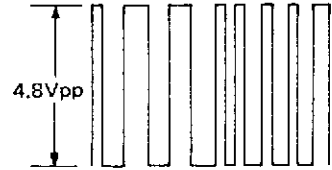

Open the cassette holder, remove the tape, push the play button and clean them with a soft cloth moistened in alcohol.

Erase protection

To protect a cassette tape from being accidentally erased it was designed with two removable tabs. By removing tabs recording mechanism does not function when the record button is pushed.

Waveforms of Cassette Tape Recorder

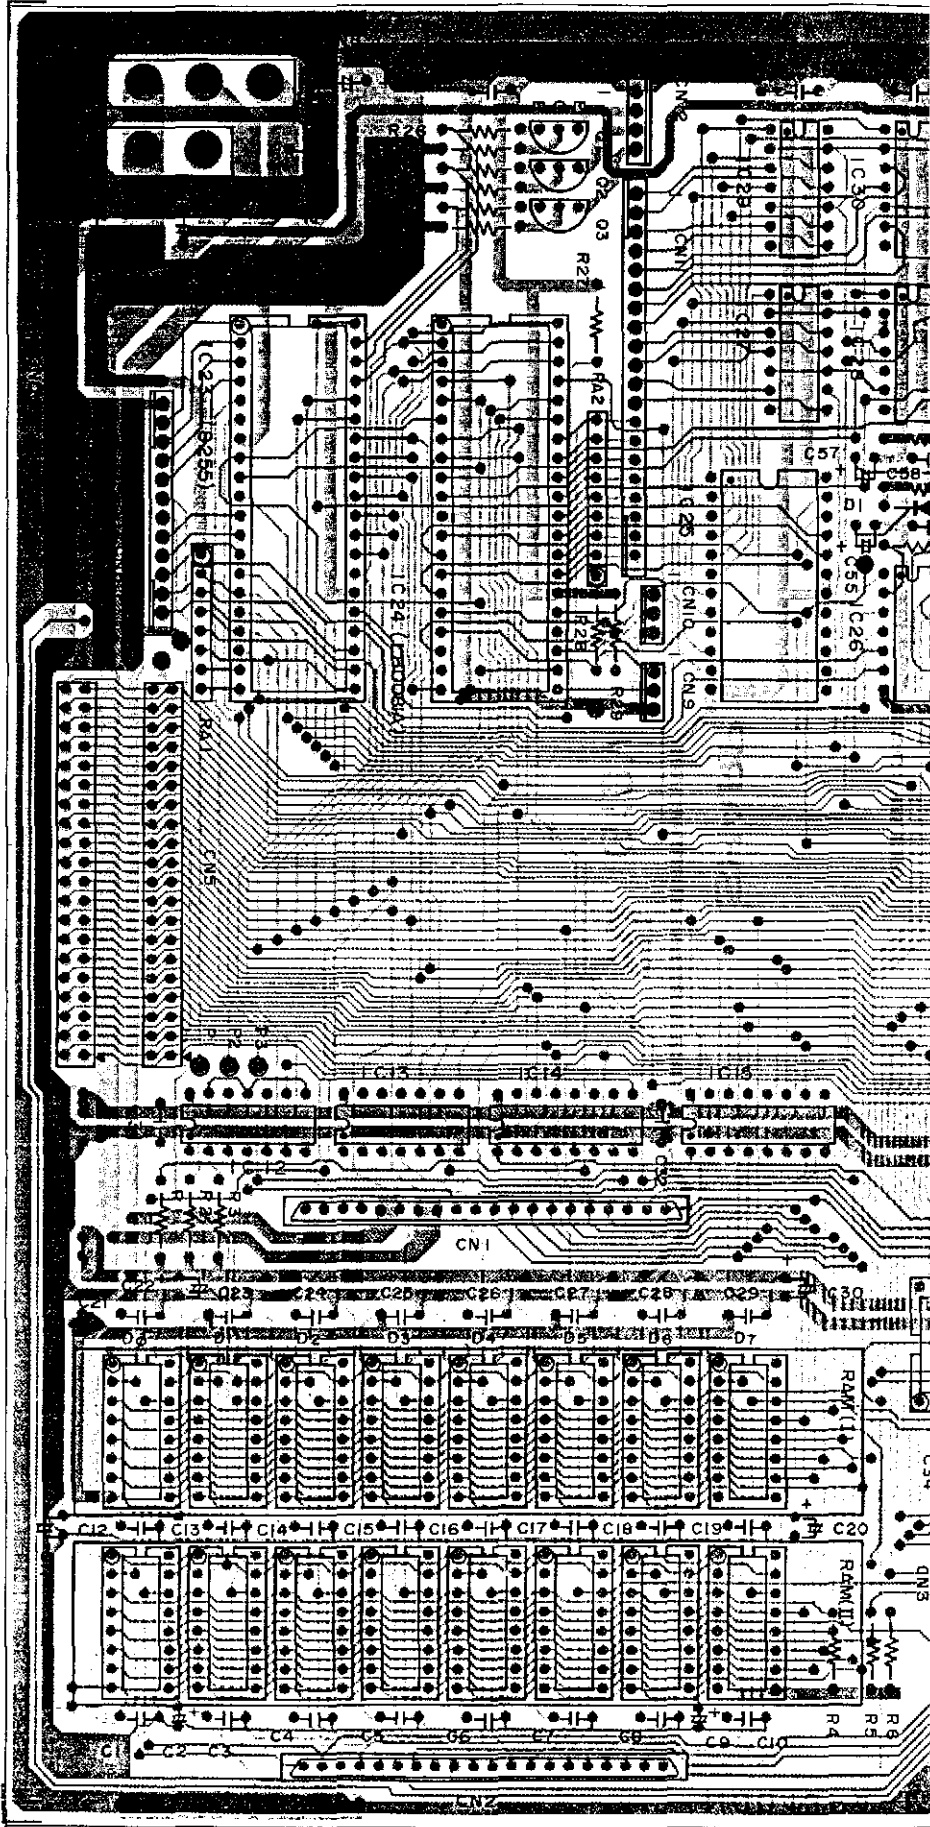

<p>1st stage amp. output waveform</p> <p>①</p>  <p>0.6Vpp</p>	<p>Operational amp. input waveform</p> <p>②</p>  <p>6mVpp</p>	<p>Operational amp. input waveform</p> <p>③</p>  <p>1.8V</p> <p>0V</p>
<p>Operational amp. input waveform</p> <p>④</p>  <p>1.5Vpp</p>	<p>Operational amp. output waveform</p> <p>⑤</p>  <p>4Vpp</p>	<p>Output waveform</p> <p>⑥</p>  <p>5Vpp</p>

Explanation of Floppy Controller MB8866

Terminal Connection Chart

Terminal name and explanation of functions

Terminal No.	Terminal Name	Symbol	I/O	Explanation of Functions
20	POWER SUPPLY	V _{ss}	I	Ground
21		V _{cc}	I	+5V power terminal
19	MASTER RESET	\overline{MR}	I	With $\overline{MR} = 0$, MASTER RESET starts, STR7 bit () 0 is reset and becomes SCR (01) _H , CR (03) _H . The restore command is activated with a rise from MR low to high.
Computer Interface				
2	WRITE ENABLE	\overline{WE}	I	It is the strobe input terminal only for data write-in to the inner register. With $\overline{CS} = 0$ and $\overline{WE} = 0$, write-in is possible.
3	CHIP SELECT	\overline{CS}	I	It is the chip selection signal. With $\overline{CS} = 0$, the chip is selected and sending and receiving of data with the computer is possible.
4	READ ENABLE	\overline{RE}	I	It is the strobe input terminal for read-out of data in the inner register. With $\overline{CS} = 0$ and $\overline{RE} = 0$, read-out is possible.
5 6	REGISTER SELECT LINE	A ₀ A ₁	I	It is the input terminal for selection of the inner register. Selected registers are CR, STR, TR, SCR and DR.
7 14	DATA ACCESS LINE	$\overline{DAL0}$ } $\overline{DAL7}$	I/O	It is an 8-bite, two-way data input terminal. When $\overline{CS} = 1$, it is high impedance. Signal polarity is reverse. (Negative logic)
24	CLOCK	CLK	I	It is the input terminal for the 2MHz standard clock. In the case of a mini floppy disk, it is 1MHz.

Terminal No.	Terminal Name	Symbol	I/O	Explanation of Functions
38	DATA REQUEST	DRQ	O	It is the open drain output and, when DRQ = 1, it indicates byte data accumulated in DR in case of read-out. In case of write-in, DR is empty and it indicates a demand for data. DRQ is reset through the function of write-in or read-out. Connect a 10KΩ blew up resistance.
39	INTERRUPT REQUEST	IRQ	O	It is the open drain output and with generation of command end, stop or interruption of type IV command, IRQ = 1. It is reset with the write-in of the following command or read-out of STR. Blew up resistance is 10KΩ.
Floppy Interface				
15	STEP	STEP	O	The step output generates a step pulse for moving the head. There is 1 pulse for 1 step.
16	DIRECTION	DIRC	O	It is the terminal showing the direction of head movement. With DIRC = 0, the head moves outward and with DIRC = 1 the head moves inward.
17	EARLY	EARLY	O	It is the output terminal for write preconvension and when EARLY = 1 it indicates that serial data output from WD should be shifted faster.
18	LATE	LATE	O	It is the output terminal for write preconvension and when LATE = 1 it indicates that serial data output from WD should be shifted slower.
22	TEST	TEST	I	Input terminal used only for chip testing. (When TEST = 0, delay due to the inner timer is ignored) The user should connect this terminal to 5V or leave it open.
23	HEAD LOAD TIMING	HLT	I	It is the settle input signal for the head after a head load command (HLD = 1). It engages when HLT = 1.
25	READ GATE	RG	O	With RG = 1, it informs the external data separator of a check of the field only when FDC is 0 (in case of FM) or of the field only when it is 0 or 1 (in case of MFM). It is the signal for taking this simultaneously.
26	READ CLOCK	RCLK	I	This is a signal for making a window in the data. It is developed in response to external data flow and is input on the FDC side. Related to RAW READ, rising and falling is important but level (high or low) is not important.
27	RAW READ	RAW READ	I	This is raw data directly input from the disk drive. It is used when receiving a signal and data is indicated by a negative pulse.
28	HEAD LOAD	HLD	O	It is the output terminal for controlling whether the head is pressed down to the media or not. The head is pressed down to the media when HLD = 1. The head is separated when HLD = 0.
29	TRACK GREATER THAN 43	TG43	O	It indicates that the head is positioned from track 44 to 76 when TG43 = 1. It indicates that it is from track 00 to track 43 when TG43 = 0. This output signal is effective only at the time of read/write commands.
30	WRITE GATE	WG	O	Output indicating that data is being written into the disk. It indicates data write-in when WG = 1.
31	WRITE DATA	WD	O	It is an output for read-in data to the disk. Pulse width for MFM is 250ns and for FM it is 500ns. Both data and address mark are output together at the same time in the case of both FM and MFM.
32	READY	READY	I	It indicates that the disk drive is ready for operation when READY = 1 and read/write operations are performed. When READY = 0, it indicates that the disk drive is not ready for operation, read/write operations are not performed and IRQ = 1. Namely, seek is carried out without reference to the READY condition. It indicates the polarity of the READY input is inverted to STR 7.
33	WRITE FAULT	WF	I	It is the input for trouble checks during write-in to the disk. It indicates an error during write-in when WF = 0. The write command is stopped and the WRITE FAULT status bite set.
34	TRACK 00	TR00	I	Input indicating whether the head position is in track 00 or not. It indicates track 00 is being checked when TR00 = 0.
35	INDEX PULSE	IP	I	Input indicating that the index pulse of the disk is being checked. It indicates the index pulse is being checked when IP = 0.
36	WRITE PROTECT	WRPT	I	Input indicating that write-in to the disk is forbidden. When a write command is started, generally WPRT is sampled and if WPRT = 0 the command is stopped and WRITE PROTECT status bite is set.
37	DOUBLE DENSITY	DDEN	I	This input is for selection of single or double density operation. Double density is selected when DDEN = 0 and single when DDEN = 1.
40 1	NON CONNECTION	NC		

■ Adjustment

Adjust and check the following when exchanging IC7, 20, 26 (74LS123N), TR1 and their peripherals.

When adjusting, add power voltage 5V to TP7 (+5V) and TP9 (0V) and apply 4MHz clock (duty ratio 50%, TTL level) to TP2.

VR1 Adjustment

As shown in Fig. 1, apply a negative pulse with a period of more than $30\mu\text{s} \sim 50\mu\text{s}$ to TP3 (READ DATA). At this time, adjust VR1 so that the width of the negative pulse appearing at TP5 is $5\mu\text{s}$.

Fig. 1

VR2 Adjustment

Apply a negative pulse with a period of $5\mu\text{s}$ to TP3 (READ DATA). At this time, adjust VR2 so that the width of the negative pulse appearing at TP4 is $1\mu\text{s}$.

Fig. 2

VR3 Adjustment

Apply a negative pulse with a period of $4\mu\text{s}$ to TP3. At this time, adjust VR3 so that the voltage of TP8 is 2.65V. After adjusting, change the period of the negative pulse added to TP3 and check that the VCO output is within a periodic range of $4\mu\text{s} \pm 1\mu\text{s}$.

Adjustment range

The following shows the adjustment range for each adjustment.

- VR1 adjustment $5\mu\text{s} \pm 0.2\mu\text{s}$
- VR2 adjustment $1\mu\text{s} \pm 0.04\mu\text{s}$
- VR3 adjustment $2.65\text{V} \pm 0.05\text{V}$

■ Packing Method

Floppy Disk **MZ-80FB**

Expansion Floppy Disk **MZ-80FBK**

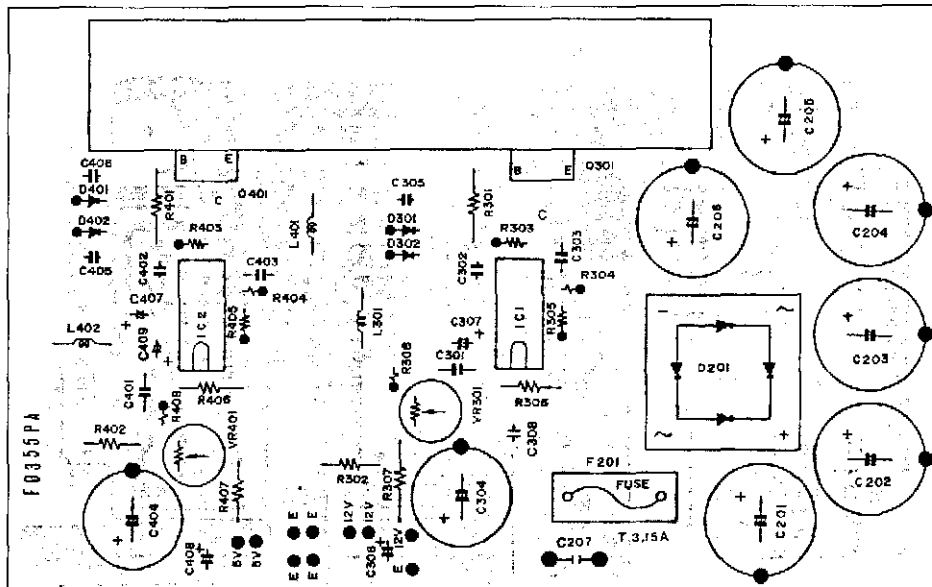

- For the system of MZ-80B, MZ-80FB/MZ-80FBK mechanically differ from MZ-80FD/MZ-80FDK (for the system of MZ-80K) in signal connector on the rear side and power supply circuit. However, the disk drive are the same as those of the MZ-80FD/MZ-80FDK in circuit design. Use the service manual of the MZ-80FD/MZ-80FDK for service.
